Motivation.

- Satisfiability (SAT) is the problem of determining if there is an interpretation that satisfies a given boolean formula in conjunctive normal form.
- SAT is an NP-Complete problem, therefore we don't expect to have polynomial algorithms for it.
- SAT is very important because many other problems can be encoded as satisfiability.
- Even though SAT is NP-Complete, we can solve efficiently many hard real life problems.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Even though an unsatisfiable formula may have a short refutation, finding it might be hard.

Motivation.

- Conflict Driven Clause Learning (CDCL) is the main technique for solving SAT
- When formulas are unsatisfiable, CDCL is equivalent to Resolution.
- Some basic problems, like pigeon-hole principle, cannot have short Resolution Refutations.
- Research on stronger proof systems, like Extended Resolution or Cutting Planes, for refuting some formulas efficiently, has failed.
- Ideas for improvements of SAT solving procedures for some hard crafted instances.

Dual-Rail Approach

- Encode the principle as a partial MaxSAT problem using the dual-rail encoding;
- then use MaxSAT.
- Advantages:

Polynomial size encodings.

We can use MaxSAT algorithms, like core-guided or minimum hitting set.

Method efficiently solves some hard problems for Resolution, like pigeon-hole.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Topic of present work: what is the real power of dual-rail MaxSAT technique compared with other proof systems?

MaxSAT and Partial MaxSAT

- Need to give weights to clauses, weight indicating the "cost" of falsifying the clause.
- Clauses are partitioned into *soft* clauses and *hard* clauses.
- Soft clauses may be falsified and have weight 1; hard clauses may not be falsified and have weight ⊤.

Definition

So *Partial MaxSAT* is the problem of finding an assignment that satisfies all the hard clauses and minimizes the number of falsified soft clauses.

Dual-Rail MaxSAT [Ignatiev-Morgado-MarquesSilva].

- Γ a set of hard clauses over the variables $\{x_1, \ldots, x_N\}$.
- The dual-rail encoding Γ^{dr} of Γ, uses 2N variables n₁,..., n_N and p₁,..., p_N in place of variables x_i.
- p_i is true if x_i is true, and that n_i is true if x_i is false.
- C^{dr} of a clause C:
 - replace (unnegated) x_i with $\overline{n_i}$, and (negated) $\overline{x_i}$ with $\overline{p_i}$.
 - **Example:** if C is $\{x_1, \overline{x_3}, x_4\}$, then C^{dr} is $\{\overline{n_1}, \overline{p_3}, \overline{n_4}\}$.
 - Every literal in C^{dr} is negated.
- dual rail encoding Γ^{dr} of Γ contains:
 - 1. The hard clause C^{dr} for each $C \in \Gamma$.
 - 2. The hard clauses $\overline{p_i} \vee \overline{n_i}$ for $1 \le i \le N$.
 - 3. The soft clauses p_i and n_i for $1 \le i \le N$.

Dual-Rail MaxSAT approach

Lemma (Ignatiev-Morgado-Marques-Silva)

 Γ is satisfiable if and only if there is an assignment that satisfies all the hard clauses of Γ^{dr} , and N of the soft ones.

Corollary

 Γ is unsatisfiable iff every assignment that satisfies all hard clauses of Γ^{dr} , must falsify at least N + 1 soft clauses.

In the context of proof systems:

 Γ is unsatisfiable, if using a proof system for Partical MaxSAT, we can obtain at least N + 1 empty clauses (\perp).

MaxSAT Inference Rule. [Larrosa-Heras, Bonet-Levy-Manya]

(Partial) MaxSAT rule, **replaces** two clauses by a different set of clauses.

A clause may be used only once as a hypothesis of an inference.

$$\begin{array}{cccc} (x \lor A, 1) & (x \lor A, 1) & (x \lor A, \top) \\ \hline (\overline{x} \lor B, \top) & (\overline{x} \lor B, 1) & (\overline{x} \lor B, 1) \\ \hline (A \lor B, 1) & (A \lor B, 1) & (A \lor B, 1) \\ \hline (x \lor A \lor \overline{B}, 1) & (x \lor A \lor \overline{B}, 1) & (x \lor A, \top) \\ \hline (\overline{x} \lor B, \top) & (\overline{x} \lor \overline{A} \lor B, 1) & (\overline{x} \lor B, \top) \end{array}$$

 $x \lor A \lor \overline{B}$, where $A = a_1 \lor \cdots \lor a_s$, $B = b_1 \lor \cdots \lor b_t$ and t > 0, is

$$\begin{array}{l} x \lor a_1 \lor \cdots \lor a_s \lor \overline{b}_1 \\ x \lor a_1 \lor \cdots \lor a_s \lor b_1 \lor \overline{b}_2 \\ \cdots \\ x \lor a_1 \lor \cdots \lor a_s \lor b_1 \lor \cdots \lor b_{t-1} \lor \overline{b_t} \end{array}$$
(1)

Example

Consider the unsatisfiable set of clauses: $\overline{x_1} \lor x_2$, x_1 and $\overline{x_2}$. The dual rail encoding has the five hard clauses

$$\overline{p_1} \lor \overline{n_2}$$
 $\overline{n_1}$ $\overline{p_2}$ $\overline{p_1} \lor \overline{n_1}$ $\overline{p_2} \lor \overline{n_2}$,

plus the four soft unit clauses

$$p_1 n_1 p_2 n_2$$
.

Since there are two variables, a dual-rail MaxSAT refutation must derive a multiset containing three copies of the empty clause \perp .

$$\begin{array}{cccc} (\overline{n_1},\top) & (\overline{p_2},\top) & (p_1,1) \\ (n_1,1) & (p_2,1) & (\overline{p_1}\vee\overline{n_2},\top) & (\overline{n_2},1) \\ (\overline{n_1},\top) & (\overline{p_2},\top) & (p_1\vee n_2,1) & (\underline{1},1) \\ (\overline{p_1}\vee\overline{n_2},\top) & (\overline{p_1}\vee\overline{n_2},\top) & (\underline{1},1) \end{array}$$

Core-guided Algorithm for MaxSAT

```
1. Input: F = S \cup H, soft clauses S and hard clauses H
2. (R, F_W, \lambda) \rightarrow (\emptyset, S \cup H, 0)
3. while true do
             (st, C, A) \rightarrow SAT(F_W)
4.
5.
             if st then return \lambda, A
6.
         \lambda \rightarrow \lambda + 1
7.
         for c \in C \cap S do
8.
                       R \rightarrow R \cup \{r\} // r is a fresh variable
9.
                       S \rightarrow S \setminus \{c\}
10.
                      H \rightarrow H \cup \{c \cup \{r\}\}
               F_W \to S \cup H \cup CNF(\sum_{r \in R} r \leq \lambda)
11.
```

Relevant Proof Systems

A **Frege** system is a textbook-style proof system, usually defined to have modus ponens as its only rule of inference.

An AC^0 -**Frege** proof is a Frege proof with a constant upper bound on the depth of formulas appearing in the Frege proof.

 AC^0 -**Frege**+**PHP** is constant depth Frege augmented with the schematic pigeonhole principle.

The **Cutting Planes** system is a pseudo-Boolean propositional proof system, with variables taking on 0/1 values. The lines of a cutting planes proof are inequalities of the form

$$a_1x_1+a_2x_2+\ldots+a_nx_n\geq a_{n+1},$$

where the a_i 's are integers. Logical axioms are $x_i \ge 0$ and $-x_i \ge -1$; rules are addition, multiplication by a integer, and a special division rule.

The Pigeonhole principle

There is no 1 - 1 function from [n + 1] to [n]. Set of clauses:

$$\begin{array}{ll} \bigvee_{j=1}^{n} \mathbf{x}_{i,j} & \quad \text{for } i \in [n+1] \\ \\ \overline{\mathbf{x}_{i,j}} \lor \overline{\mathbf{x}_{k,j}} & \quad \text{for distinct } i,k \in [n+1]. \end{array}$$

[Cook-Reckhow] Polynomial size **extended Frege** proofs of PHP_n^{n+1} .

[Buss'87] Polynomial size **Frege** proofs of PHP_n^{n+1} .

[Haken'85] **Resolution** requires exponential size refutations of PHP_n^{n+1} .

Polynomial size **Cutting Planes** refutations of PHP_n^{n+1} .

Translation of the PHP to the dual-rail Language.

The dual-rail encoding, $(PHP_n^{n+1})^{dr}$ of PHP_n^{n+1} . Hard clauses:

| $\bigvee_{j=1}^{n}\overline{n_{i,j}}$ | for $i \in [n+1]$ |
|--|---|
| $\overline{p_{i,j}} \vee \overline{p_{k,j}}$ | for $j \in [n]$ and distinct $i, k \in [n+1]$. |

Soft clauses are:

Unit clauses $\mathbf{n}_{i,j}$ and $\mathbf{p}_{i,j}$ for all $i \in [n+1]$ and $j \in [n]$.

[Ignatiev-Morgado-MarquesSilva] Polynonial sequence of Partial MaxSAT resolution steps to obtain (n+1)n+1 soft empty clauses \perp .

[Bonet-Levy-Manya] MaxSAT rule requires exponential number of steps to show one clause cannot be satisfied, when using usual encoding.

Relationship of dual-rail MaxSAT and Resolution

Theorem

The core-guided MaxSAT algorithm with the dual-rail encoding simulates Resolution.

Theorem

Multiple dual rail MaxSAT simulates tree-like Resolution.

Theorem

Weighted dual rail MaxSAT simulates general Resolution.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ののの

Dual-rail Core-guided MaxSAT simulation of Resolution

Now we have all clauses with p_i vars. Follow resolution refutation.

Dual-rail MaxSAT simulation of Resolution

$$\begin{array}{c} (p_i, w_i) \\ (\overline{p_i} \lor \overline{n_i}, \top) \\ \hline (\overline{n_i}, w_i) \\ (p_i \lor n_i, w_i) \\ (\overline{p_i} \lor \overline{n_i}, \top) \end{array} \qquad \begin{array}{c} (\overline{n_i}, w_i) \\ (\overline{n_i}, w_i) \\ (\overline{\perp}, w_i) \\ (\overline{p_i} \lor \overline{n_i}, \top) \end{array} \qquad \begin{array}{c} (C \lor \overline{n_i}, \top) \\ \hline (p_i \lor n_i, w_i) \\ (\overline{\perp}, w_i) \\ \text{other clauses} \end{array}$$

We used soft clauses n_i and p_i , and obtained soft \perp and $p_i \lor n_i$. Soft clauses n_i and p_i will have considerable weight initially, $p_i \lor n_i$ will have weight to eliminate n_i variables, weights will be used to account for several uses of a clause in the refutation.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The Parity Principle.

Given a graph with an odd number of vertices, it is not posible to have every vertex with degree one.

The propositional version of the Parity Principle, for $m \ge 1$, uses $\binom{2m+1}{2}$ variables $x_{i,j}$, where $i \ne j$ and $x_{i,j}$ is identified with $x_{j,i}$. Meaning of $x_{i,j}$: there is an edge between vertex *i* and vertex *j*.

The **Parity Principle**, $Parity^{2m+1}$,

| $igvee_{\mathbf{j} eq \mathbf{i}} \mathbf{x}_{\mathbf{i},\mathbf{j}}$ | for $i \in [2m+1]$ |
|---|--|
| $\overline{\mathbf{x_{i,j}}} \lor \overline{\mathbf{x_{k,j}}}$ | for i, j, k distinct members of $[2m+1]$ |

Results using the Parity Principle

Theorem AC⁰-Frege+PHP p-simulates the dual-rail MaxSAT system.

Theorem (Beame-Pitassi)

AC⁰-Frege+PHP refutations of Parity require exponential size.

Corollary

MaxSAT refutations of the dual-rail encoded Parity Principle require exponential size.

Corollary

The dual rail MaxSAT proof system does not polynomially simulate CP.

Fact

Dual-rail minimum hitting set algorithm has short proofs of the Parity principle.

AC⁰-Frege+PHP p-simulation the dual-rail MaxSAT

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

if 2m+1 pigeons are mapped to m holes then some hole contains at least three pigeons.

Set of clauses of $2PHP_m^{2m+1}$:

 $\begin{array}{ll} \bigvee_{\mathbf{j}=1}^{\mathbf{m}} \mathbf{x}_{\mathbf{i},\mathbf{j}} & \text{ for } i \in [2m+1] \\ \\ \overline{\mathbf{x}_{\mathbf{i},\mathbf{j}}} \lor \overline{\mathbf{x}_{\mathbf{k},\mathbf{j}}} \lor \overline{\mathbf{x}_{\ell,\mathbf{j}}} & \text{ for distinct } i, k, \ell \in [2m+1]. \end{array}$

Translation of the Double PHP to dual-rail

The dual-rail encoding, $(2PHP^{2m+1})^{dr}$, of $2PHP_m^{2m+1}$. Hard clauses:

 $\begin{array}{ll} \bigvee_{j=1}^{m} \overline{\mathbf{n}_{i,j}} & \text{for } i \in [2m+1] \\ \\ \overline{\mathbf{p}_{i,j}} \lor \overline{\mathbf{p}_{k,j}} \lor \overline{\mathbf{p}_{\ell,j}} & \text{for } j \in [m] \text{ and} \\ & \text{distinct } i, k, \ell \in [2m+1]. \end{array}$

Soft clauses are:

 $\mathbf{n}_{i,j}$ and $\mathbf{p}_{i,j}$ for all $i \in [2m+1]$ and $j \in [m]$.

Theorem

There are polynomial size MaxSAT refutations of the dual rail encoding of the $2PHP_m^{2m+1}$.

Experimentation

Performance of SAT and MaxSAT solvers on $2PHP_m^{2m+1}$.

ж

Summary of Results

- dual-rail MaxSAT is strictly stronger than Resolution.
- A stronger pigeon-hole principle also has polynomial-size proofs in dual-rail MaxSAT, but requires exponential size in Resolution.
- We did experimentation with such pigeon-hole principle to back up the theoretical results.
