Introduction 0●0000	Topological recursion	Refinement 000000000	Free energy 000000000000	Refined BPS structures
History/mo	tivation			

Topological recursion (TR) [Eynard-Orantin, Chekhov-Eynard-Orantin]:

- Matrix models (loop equations)
- Enumerative geometry (Kontsevich-Witten, Gromov-Witten, Hurwitz, Mirzakhani-Weil-Petersson...)
- Differential equations, WKB analysis

## History/motivation

Topological recursion (TR) [Eynard-Orantin, Chekhov-Eynard-Orantin]:

- Matrix models (loop equations)
- Enumerative geometry (Kontsevich-Witten, Gromov-Witten, Hurwitz, Mirzakhani-Weil-Petersson...)
- Differential equations, WKB analysis

Refined /  $\beta$ -deformed TR [Perm{Chekhov,Eynard,Marchal},

Brini-Marino-Stevan, Manabe-Sulkowski, K-Osuga]:

- $\beta$ -ensemble analogue to topological recursion
- Several approaches (matrix models, noncommutative spectral curve,...)
- Pure geometric theory formulated and proved in special case by [K-Osuga]

Introduction	Topological	recursion
00000	000000	

Refinement

Free energy

Refined BPS structures

# History/motivation

• Motivation: generalize [Iwaki-K] free energy formula involving Donaldson-Thomas invariants to refined setting.

Omar Kidwai

Department of Mathematics, CUHK

• Consider spectral curves related to "hypergeometric" curve

$$y^{2} = \frac{m_{\infty}^{2}x^{2} - (m_{\infty}^{2} + m_{0}^{2} - m_{1}^{2})x + m_{0}^{2}}{x^{2}(x-1)^{2}}$$

- + 8 other examples arising from limits/confluence.
- In particular,
  - Compute refined topological recursion free energy (proof when no 2nd order poles - conjecture for others)
  - Interpret in terms of refined BPS structure

Introduction Topological recursion Refinement

Free energy

Refined BPS structures

# Spectral curves of hypergeometric type

All are genus 0, degree two curves,

$$y^2 = Q(x)$$

Name	Q(x)	Assumption
Gauss (HG)	$\frac{m_{\infty}^2 x^2 - (m_{\infty}^2 + m_0^2 - m_1^2)x + m_0^2}{x^2(x-1)^2}$	$m_0, m_1, m_\infty \neq 0,$ $m_0 \pm m_1 \pm m_\infty \neq 0.$
Degenerate Gauss (dHG)	$\frac{m_{\infty}^2 x + m_1^2 - m_{\infty}^2}{x(x-1)^2}$	$m_1, m_\infty  e 0, \ m_1 \pm m_\infty  e 0.$
Kummer (Kum)	$\frac{x^2 + 4m_{\infty}x + 4m_0^2}{4x^2}$	$m_0 \neq 0, m_0 \pm m_\infty \neq 0.$
Legendre (Leg)	$rac{m_{\infty}^2}{x^2-1}$	$m_{\infty}  eq 0.$
Bessel (Bes)	$\frac{x+4m^2}{4x^2}$	$m \neq 0.$

Omar Kidwai

Refined topological recursion free energy for hypergeometric type curves

Department of Mathematics, CUHK

< < >> < <</>

Note for our examples we can give some explicit parametrization to obtain a TR spectral curve,

e.g. for Whittaker  $y^2 = rac{x-4m}{4x}$  take  $\mathcal{C} = \mathbb{P}^1$ ,

$$x(\zeta) = 2m\left(rac{1}{\zeta-1}-rac{1}{\zeta+1}
ight), \quad y(\zeta) = -rac{1}{2}\zeta$$

giving  $\mathcal{R} = \{0, \infty\}$ . There is a global involution  $\sigma(\zeta) = -\sigma(\zeta)$  fixing x and sending  $y \mapsto -y$ .

Fact:  $\omega_{g,n}|_{\Omega=0}$  reproduce the unrefined  $\omega_{g,n}$  (with the understanding  $\omega_{g,n} = 0$  for  $g \in \frac{1}{2} + \mathbb{Z}_{\geq 0}$ ).

э

ntroduction	Topological recursion	Refinement 0000000●0	Free energy 000000000000	Refined BPS structu
Properties				

Fact:  $\omega_{g,n}|_{\Omega=0}$  reproduce the unrefined  $\omega_{g,n}$  (with the understanding  $\omega_{g,n} = 0$  for  $g \in \frac{1}{2} + \mathbb{Z}_{\geq 0}$ ).

Furthermore, analogous properties to the unrefined case hold, though with with more interesting pole structure.

**Theorem** [K-Osuga Adv. Math. 2023]. For nice degree two genus zero refined spectral curve,  $\omega_{g,n+1}$  satisfy:

- **1** The multidifferential  $\omega_{g,n+1}$  is symmetric;
- 2 All poles of  $\omega_{g,n+1}$  (in any variable) lie in  $\mathcal{R}^* \cup \sigma(p_{J_0})$ ;
- **3** At any  $o \in \Sigma$ ,  $\omega_{g,n+1}$  is residue-free in the first (thus, any) variable:

$$\operatorname{Res}_{\boldsymbol{p}=\boldsymbol{o}}\omega_{\boldsymbol{g},\boldsymbol{n+1}}(\boldsymbol{p},\boldsymbol{p}_J)=\boldsymbol{0};$$

4 For (g, n) with n > 0, we have

$$(2g+n-2)\omega_{g,n}(J) = -\left(\sum_{r\in\mathcal{R}^*}\operatorname{Res}_{p=r} + \sum_{r\in\sigma(p_J)}\operatorname{Res}_{p=r}\right)\Phi(p)\cdot\omega_{g,n+1}(p,p_J).$$

Refined topological recursion free energy for hypergeometric type curves

Definition is exactly the same as before:

$$F_g = \frac{1}{2 - 2g} \sum_{r \in \mathcal{R}} \operatorname{Res}_{z=r} \left[ \Phi(z) \omega_{g,1}(z) \right]$$

for  $\Phi$  a primitive of *ydx*, where now  $g \in \frac{1}{2}\mathbb{Z}_{>1}$

How to prove?

Refined topological recursion free energy for hypergeometric type curves

Department of Mathematics, CUHK

28 / 35

### How to prove?

Similar to Iwake-Koike-Takei, we consider Voros coefficient<sup>1</sup>:

$$V = \sum_{k=1}^{\infty} \hbar^k \int_{\infty_-}^{\infty_+} \left( \sum_{\substack{2g-2+n=k\\g\geq 0,n\geq 1}} \frac{1}{\beta^{n/2}n!} \frac{d}{dz} \int_{D(z;\nu)} \dots \int_{D(z;\nu)} \omega_{g,n}(\zeta_1,\dots,\zeta_n) \right)$$

where

$$D(z; \boldsymbol{\nu}) := [z] - \sum_{\boldsymbol{p} \in \mathcal{P}'} \nu_{\boldsymbol{p}}[\boldsymbol{p}], \qquad \sum_{\boldsymbol{p} \in \mathcal{P}'} \nu_{\boldsymbol{p}} = 1,$$

and  $\infty_\pm$  denotes the preimages under x of  $\infty$ 

 <sup>1</sup> of the corresponding quantum curve [K-Osuga]
 Image: Algorithm of the corresponding quantum curve [K-Osuga]

 Omar Kidwai
 Department of Mathematics, CUHK

 Refined topological recursion free energy for hypergeometric type curves
 28 / 35

We rely on the relation (as f.p.s. in  $\hbar$ ) between V and F:

$$V = F\left(\widehat{m} + \frac{\hbar}{2\beta^{\frac{1}{2}}}\right) - F\left(\widehat{m} - \frac{\hbar}{2\beta^{\frac{1}{2}}}\right) + \text{l.o.}$$

where

$$\widehat{m}=m-\frac{\nu\hbar}{2\beta^{\frac{1}{2}}}.$$

-

and  $F := \sum_{g} \hbar^{2g-2} F_{g}$ .

Omar Kidwai

<u>Problem</u>: It is false for the more complicated HG type curves (whenever  $Q(x)dx^2$  has a 2nd order pole), and for  $\beta$  case less trivial to prove even when it is true.

<u>Why?</u> V is like a limit of (log of) wavefunction  $\psi$  but the expression for  $\psi$  is not continuous at the limiting points!

$$\lim_{p\to\sigma(q_0)}\int_{q_0}^p\cdots\int_{q_n}^p\omega_{g,n+1}\neq\int_{q_0}^{\sigma(q_0)}\cdots\int_{q_n}^{(q_n)}\omega_{g,n+1}$$

can occur if  $q_i \in \mathcal{P}$ .

Department of Mathematics, CUHK

Omar Kidwai

Toy example

Consider integrating

$$\omega(\zeta_0,\zeta_1) = \frac{\zeta_0^2 + \zeta_1^2 + \zeta_0^2 \zeta_1^2 + 3\zeta_0 \zeta_1}{\zeta_0^2 \zeta_1^2 (\zeta_0 + \zeta_1)^3} d\zeta_0 d\zeta_1$$
  
from  $q_0 = q_1 = -1$ ,  $\sigma(\zeta) = -\zeta$ . Then  
$$\int_{-1}^1 \int_{-1}^1 \omega = 0,$$

and even  $\int_a^1 \int_{-1}^1 \omega = 0$  for any *a*. Yet

$$\int_{-1}^{z} \int_{-1}^{z} \omega = -\frac{(1+z)^2(2z-1)}{4z^3} \xrightarrow[z \to 1]{} -1,$$

In fact,

$$\int_{a}^{z} \int_{-1}^{z} \omega = \frac{(1-z)(1+z)}{2z\zeta_{0}(z+\zeta_{0})} \Big|_{\zeta_{0}=a}^{\zeta_{0}=z} = \frac{(1-z)(1+z)}{4z^{3}} - \frac{(1-z)(1+z)}{2za(z+a)}.$$

#### Omar Kidwai

Refined topological recursion free energy for hypergeometric type curves

This kind of phenomenon happens in all the cases where  $Q(x)dx^2$  has a second order pole.

Refined topological recursion free energy for hypergeometric type curves

This kind of phenomenon happens in all the cases where  $Q(x)dx^2$  has a second order pole.

<u>Solution</u>: Treat only Weber/Whittaker cases, show that partial integrals defining Voros coefficient are uniformly bounded to justify limit.

This kind of phenomenon happens in all the cases where  $Q(x)dx^2$  has a second order pole.

<u>Solution</u>: Treat only Weber/Whittaker cases, show that partial integrals defining Voros coefficient are uniformly bounded to justify limit.

Then use "contiguity relations" relating Voros coeffs for classical ODEs, get difference eqn for F.

Introduction 000000	Topological recursion	Refinement 000000000	Free energy 000000000●00	Refined BPS structures
Proof				

### Let

$$\begin{aligned} \Delta_{\epsilon_1,\epsilon_2} \cdot f(m;\hbar) \\ &= -f\left(m - \frac{\epsilon_1}{2} - \frac{\epsilon_2}{2};\hbar\right) + f\left(m - \frac{\epsilon_1}{2} + \frac{\epsilon_2}{2};\hbar\right) + f\left(m + \frac{\epsilon_1}{2} - \frac{\epsilon_2}{2};\hbar\right) - f\left(m + \frac{\epsilon_1}{2} + \frac{\epsilon_2}{2};\hbar\right) \end{aligned}$$

Then for Weber,

$$\Delta_{\epsilon_1,\epsilon_2} \cdot F = \log\left(m + rac{\mu}{2} \Omega \hbar
ight)$$

and for Whittaker,

$$\Delta_{\epsilon_1,\epsilon_2} \cdot F = \log\left(m + \frac{\mu}{2}\Omega\hbar + \frac{\Omega\hbar}{2}\right) + \log\left(m + \frac{\mu}{2}\Omega\hbar - \frac{\Omega\hbar}{2}\right).$$

Omar Kidwai

Refined topological recursion free energy for hypergeometric type curves

ъ Department of Mathematics, CUHK

3

Finally, use definition of double Bernoulli polynomials to solve this difference equation.

**Theorem.** [K-Osuga] (*i*) For Weber refined spectral curve, we have

$$F_{g} = \frac{(-1)^{2g-2}}{2g(2g-1)(2g-2)} B_{2,2g} \left(\frac{\mu Q}{2} - \frac{Q}{2}\right) \left(\frac{1}{m}\right)^{2g-2g}$$

(ii) For Whittaker,

$$F_{g} = \frac{(-1)^{2g-2}}{2g(2g-1)(2g-2)} \left[ B_{2,2g}\left(\frac{\mu Q}{2}\right) + B_{2,2g}\left(\frac{\mu Q}{2} - Q\right) \right] \left(\frac{1}{m}\right)^{2g-2}$$

(iii) For degenerate Bessel, and Airy  $F_g = 0$ .

Omar Kidwai

Introduction

## GMN construction

Introduction

Gaiotto-Moore-Neitzke constructed BPS structures – we consider rank 2 case.

Choose a sufficiently nice meromorphic quadratic differential  $\varphi = Q(x)dx^{\otimes 2}$  (say, hypergeometric type).

Let  $\widetilde{\Sigma}$  denote  $\Sigma$  with simple poles filled in.

Omar Kidwai

Department of Mathematics, CUHK

## GMN construction

Define:

•  $\Gamma := \{\gamma \in H_1(\widetilde{\Sigma}, \mathbb{Z}) \, | \, \sigma_* \gamma = -\gamma \}$ ,  $\sigma$  the sheet-exchange

• 
$$Z(\gamma) := \oint_{\gamma} \lambda = \oint_{\gamma} \sqrt{Q(x)} dx$$

(in all our examples,  $\Sigma$  is genus 0,  $\Gamma$  is easy to determine and  $Z(\gamma)$  is easily computed as linear combinations of parameters  $m_i$ .

Now, to define  $\Omega: \Gamma \to \mathbb{Z}$ .

Fix  $\vartheta \in \mathbb{R}/2\pi\mathbb{Z}$ . The foliation of phase  $\vartheta$ ,  $\mathcal{F}_{\vartheta}(\varphi)$  is given by

$$\operatorname{Im} e^{-i\vartheta} \int^x \sqrt{Q(x)} dx = \operatorname{const}$$

A trajectory of phase  $\vartheta$  is any maximal leaf of  $\mathcal{F}_{\vartheta}(\varphi)$ .
